OPTIDRIVE (E2 IP20 & IP66 (NEMA 4X)

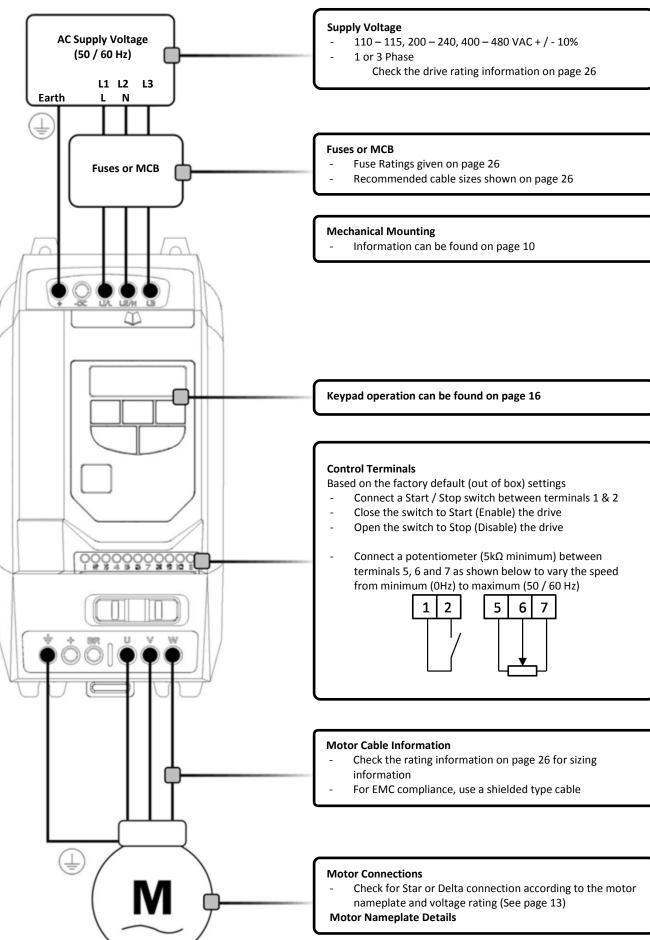

AC Variable Speed Drive

0.37 - 11kW (0.5 - 15HP) 110 - 480V

OPTIDRIVE (É² Easy Start Up Guide

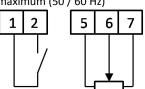

Easy Start Up Guide

Control Terminals

Based on the factory default (out of box) settings

- Connect a Start / Stop switch between terminals 1 & 2
- Close the switch to Start (Enable) the drive
- Open the switch to Stop (Disable) the drive
- Connect a potentiometer (5kΩ minimum) between terminals 5, 6 and 7 as shown below to vary the speed from minimum (0Hz) to maximum (50 / 60 Hz)

Mechanical Mounting

- Information can be found on page 10

Keypad operation can be found on page 16

Fuses or MCB

- Fuse Ratings given on page 26
- Recommended cable sizes shown on page 26

Always follow local and national codes of practice

Fuses or MCB Earth L N L1 L2 L3 AC Supply Voltage (50 / 60 Hz)

Motor Cable Information

- Check the rating information on page 26 for sizing information
- For EMC compliance, use a shielded type cable

Supply Voltage

- 110 115, 200 240, 400 480 VAC + / - 10%
- 1 or 3 Phase

Check the drive rating information on page 26

Motor Connections

 Check for Star or Delta connection according to the motor nameplate and voltage rating (See page 13)

Motor Nameplate Details

- Enter the motor rated voltage in P-07
- Enter the motor rated current in P-08
- Enter the motor rated frequency in P-09

Local Speed Potentiometer The local speed potentiometer will adjust the output frequency from minimum (Parameter P-02, default setting = 0Hz) to maximum (Parameter P-01, default setting = 50 / 60 Hz)

Run Reverse / Off / Run Forward Switch

With the factory parameter settings, this switch allows the drive to be started in the forward and reverse operating directions. Alternative switch functions can be programmed, such as Local / Remote, Hand / Auto, see page 15

Mains Disconnect / Isolator

Fuses or MCB

- Fuse Ratings given on page 26
- Recommended cable sizes shown on page 26

Always follow local and national codes of practice

Declaration of Conformity

Invertek Drives Ltd hereby states that the Optidrive ODE-2 product range conforms to the relevant safety provisions of the Low Voltage Directive 2006/95/EC and the EMC Directive 2004/108/EC and has been designed and manufactured in accordance with the following harmonised European standards:

EN 61800-5-1: 2003	Adjustable speed electrical power drive systems. Safety requirements. Electrical, thermal and energy.
EN 61800-3 2 nd Ed: 2004	Adjustable speed electrical power drive systems. EMC requirements and specific test methods
EN 55011: 2007	Limits and Methods of measurement of radio disturbance characteristics of industrial, scientific and medical (ISM) radio-frequency equipment (EMC)
EN60529 : 1992	Specifications for degrees of protection provided by enclosures

Electromagnetic Compatibility

All Optidrives are designed with high standards of EMC in mind. All versions suitable for operation on Single Phase 230 volt and Three Phase 400 volt supplies and intended for use within the European Union are fitted with an internal EMC filter. This EMC filter is designed to reduce the conducted emissions back into the supply via the power cables for compliance with the above harmonised European standards. It is the responsibility of the installer to ensure that the equipment or system into which the product is incorporated complies with the EMC legislation of the country of use. Within the European Union, equipment into which this product is incorporated must comply with the EMC Directive 2004/108/EC. When using an Optidrive with an internal or optional external filter, compliance with the following EMC Categories, as defined by EN61800-3:2004 can be achieved:

Drive Typ	pe / Rating	EMC Category							
		Cat C1	Cat C3						
1 Phase, 230 Volt Input		No additional filtering required	No additional filtering required						
ODE-2-x2	2xxx-1xBxx	Use shielded motor cable							
3 Phase, 400 Volt Input		Use External Filter OPT-2—	No additional filtering required						
ODE-2-x4	4xxx-3xAxx	E3xxxx							
		Use shielded motor cable							
Note	Compliance wit	th EMC standards is dependent on a	number of factors including the environme	nt in which the drive is installed,					
note	motor switchin	g frequency, motor, cable lengths an	d installation methods adopted.						
	For shielded me	otor cable lengths greater than 100m	and up to 200m, an output dv / dt filter m	nust be used (please refer to the					
	Invertek Stock	Drives Catalogue for further details)							
	Compliance wit	th EMC directives is achieved with th	e factory default parameter settings

All Invertek Optidrive units carry a 2 year warranty against manufacturing defects from the date of manufacture. The manufacturer accepts no liability for any damage caused during or resulting from transport, receipt of delivery, installation or commissioning. The manufacturer also accepts no liability for damage or consequences resulting from inappropriate, negligent or incorrect installation, incorrect adjustment of the operating parameters of the drive, incorrect matching of the drive to the motor, incorrect installation, unacceptable dust, moisture, corrosive substances, excessive vibration or ambient temperatures outside of the design specification.

The local distributor may offer different terms and conditions at their discretion, and in all cases concerning warranty, the local distributor should be contacted first.

1. Introduction

1.1. Important Safety Information

Please read the IMPORTANT SAFETY INFORMATION below, and all Warning and Caution information elsewhere.

Danger: Indicates a risk of electric shock, which, if not avoided, could result in damage to the equipment and possible injury or death.

Danger: Indicates a potentially hazardous situation other than electrical, which if not avoided, could result in damage to property.

This variable speed drive product (Optidrive) is intended for professional incorporation into complete equipment or systems as part of a fixed installation. If installed incorrectly it may present a safety hazard. The Optidrive uses high voltages and currents, carries a high level of stored electrical energy, and is used to control mechanical plant that may cause injury. Close attention is required to system design and electrical installation to avoid hazards in either normal operation or in the event of equipment malfunction. Only qualified electricians are allowed to install and maintain this product.

System design, installation, commissioning and maintenance must be carried out only by personnel who have the necessary training and experience. They must carefully read this safety information and the instructions in this Guide and follow all information regarding transport, storage, installation and use of the Optidrive, including the specified environmental limitations.

Do not perform any flash test or voltage withstand test on the Optidrive. Any electrical measurements required should be carried out with the Optidrive disconnected.

Electric shock hazard! Disconnect and ISOLATE the Optidrive before attempting any work on it. High voltages are present at the terminals and within the drive for up to 10 minutes after disconnection of the electrical supply. Always ensure by using a suitable multimeter that no voltage is present on any drive power terminals prior to commencing any work.

Where supply to the drive is through a plug and socket connector, do not disconnect until 10 minutes have elapsed after turning off the supply.

Ensure correct earthing connections. The earth cable must be sufficient to carry the maximum supply fault current which normally will be limited by the fuses or MCB. Suitably rated fuses or MCB should be fitted in the mains supply to the drive, according to any local legislation or codes.

Ensure correct earthing connections and cable selection as per defined by local legislation or codes. The drive may have a leakage current of greater than 3.5mA; furthermore the earth cable must be sufficient to carry the maximum supply fault current which normally will be limited by the fuses or MCB. Suitably rated fuses or MCB should be fitted in the mains supply to the drive, according to any local legislation or codes.

Do not carry out any work on the drive control cables whilst power is applied to the drive or to the external control circuits.

Within the European Union, all machinery in which this product is used must comply with Directive 2006/42/EC, Safety of Machinery. In particular, the machine manufacturer is responsible for providing a main switch and ensuring the electrical equipment complies with EN60204-1.

The level of integrity offered by the Optidrive control input functions – for example stop/start, forward/reverse and maximum speed is not sufficient for use in safety-critical applications without independent channels of protection. All applications where malfunction could cause injury or loss of life must be subject to a risk assessment and further protection provided where needed.

The driven motor can start at power up if the enable input signal is present.

The STOP function does not remove potentially lethal high voltages. ISOLATE the drive and wait 10 minutes before starting any work on it. Never carry out any work on the Drive, Motor or Motor cable whilst the input power is still applied.

The Optidrive can be programmed to operate the driven motor at speeds above or below the speed achieved when connecting the motor directly to the mains supply. Obtain confirmation from the manufacturers of the motor and the driven machine about suitability for operation over the intended speed range prior to machine start up.

Do not activate the automatic fault reset function on any systems whereby this may cause a potentially dangerous situation. IP66 drives provide their own pollution degree 2 environments. IP20 drives must be installed in a pollution degree 2 environment, mounted in a cabinet with IP54 or better.

Optidrives are intended for indoor use only.

When mounting the drive, ensure that sufficient cooling is provided. Do not carry out drilling operations with the drive in place, dust and swarf from drilling may lead to damage.

The entry of conductive or flammable foreign bodies should be prevented. Flammable material should not be placed close to the drive

Relative humidity must be less than 95% (non-condensing).

Ensure that the supply voltage, frequency and no. of phases (1 or 3 phase) correspond to the rating of the Optidrive as delivered. Never connect the mains power supply to the Output terminals U, V, W.

Do not install any type of automatic switchgear between the drive and the motor

Wherever control cabling is close to power cabling, maintain a minimum separation of 100 mm and arrange crossings at 90 degrees

Ensure that all terminals are tightened to the appropriate torque setting

Do not attempt to carry out any repair of the Optidrive. In the case of suspected fault or malfunction, contact your local Invertek Drives Sales Partner for further assistance.

2. General Information and Ratings

This chapter contains information about the Optidrive E2 including how to identify the drive

2.1. **Identifying the Drive by Model Number**

Each drive can be identified by its model number, as shown in the table below. The model number is on the shipping label and the drive nameplate. The model number includes the drive and any options.

	ODE	-	2	-	1	2	037	-	1	К	В	1	2

3. Mechanical Installation

3.1. General

- The Optidrive should be mounted in a vertical position only, on a flat, flame resistant, vibration free mounting using the integral mounting holes or DIN Rail clip (Frame Sizes 1 and 2 only).
- The Optidrive must be installed in a pollution degree 1 or 2 environment only.
- Do not mount flammable material close to the Optidrive
- Ensure that the minimum cooling air gaps, as detailed in section 3.5 and 3.7 are left clear
- Ensure that the ambient temperature range does not exceed the permissible limits for the Optidrive given in section 9.1
- Provide suitable clean, moisture and contaminant free cooling air sufficient to fulfil the cooling requirements of the Optidrive

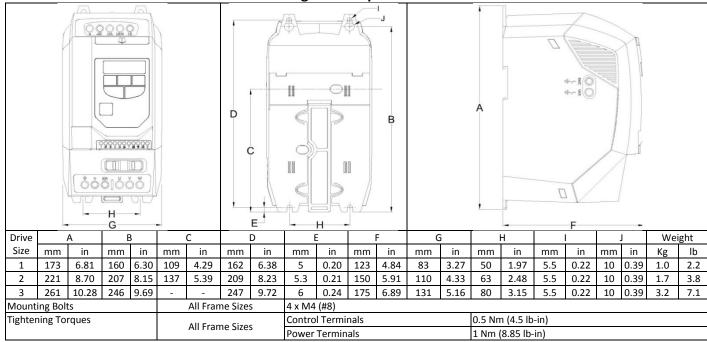

3.2. Before Installation

- Carefully Unpack the Optidrive and check for any signs of damage. Notify the shipper immediately if any exist.
- Check the drive rating label to ensure it is of the correct type and power requirements for the application.
- To prevent accidental damage always store the Optidrive in its original box until required. Storage should be clean and dry and within the temperature range –40°C to +60°C

3.3. UL Compliant Installation

Refer to section 9.3 on page 27 for Additional Information for UL Compliance.

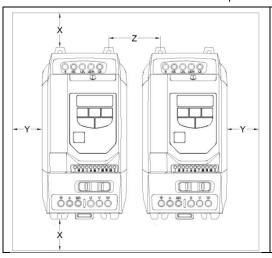

3.4. Mechanical Dimensions and Mounting – IP20 Open Units

3.5. Guidelines for Enclosure Mounting – IP20 Units

- IP20 drives are suitable for use in pollution degree 1 environments, according to IEC-664-1. For pollution degree 2 or higher environments, drives should be mounted in a suitable control cabinet with sufficient ingress protection to maintain a pollution degree 1 environment around the drive.
- Enclosures should be made from a thermally conductive material.
- Ensure the minimum air gap clearances around the drive as shown below are observed when mounting the drive.
- Where ventilated enclosures are used, there should be venting above the drive and below the drive to ensure good air circulation. Air should be drawn in below the drive and expelled above the drive.
- In any environments where the conditions require it, the enclosure must be designed to protect the Optidrive against ingress of airborne dust, corrosive gases or liquids, conductive contaminants (such as condensation, carbon dust, and metallic particles) and sprays or splashing water from all directions.
- High moisture, salt or chemical content environments should use a suitably sealed (non-vented) enclosure.

The enclosure design and layout should ensure that the adequate ventilation paths and clearances are left to allow air to circulate through the drive heatsink. Invertek Drives recommend the following minimum sizes for drives mounted in non-ventilated metallic enclosures:-

Drive Size		X ve & low	Y Either Side		Betv	Z ween	Recommended airflow
	mm	in	mm	in	mm	in	CFM (ft ³ /min)
1	50	1.97	50	1.97	33	1.30	11
2	75	2.95	50	1.97	46	1.81	11
3	100	3.94	50	1.97	52	2.05	26

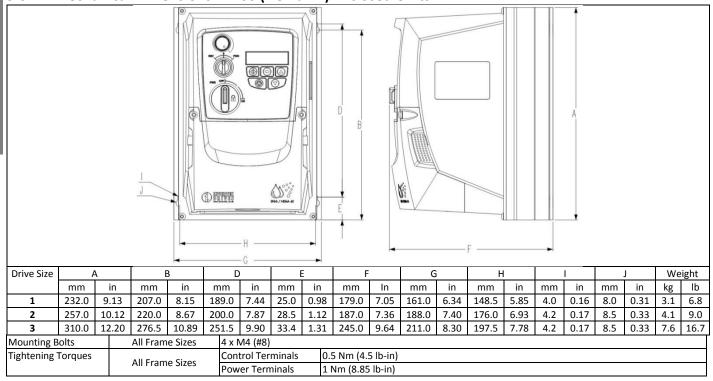

Note

Dimension Z assumes that the drives are mounted side-by-side with no clearance.

Typical drive heat losses are 3% of operating load conditions.

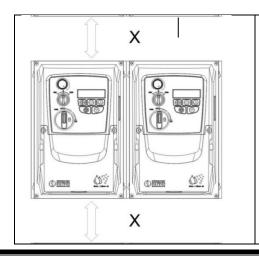

Above are guidelines only and the operating ambient temperature of the drive MUST be maintained at all times.

3.6. Mechanical Dimensions – IP66 (Nema 4X) Enclosed Units

3.7. Guidelines for mounting (IP66 Units)

- Before mounting the drive, ensure that the chosen location meets the environmental condition requirements for the drive shown in section 9.1
- The drive must be mounted vertically, on a suitable flat surface
- The minimum mounting clearances as shown in the table below must be observed
- The mounting site and chosen mountings should be sufficient to support the weight of the drives
- Using the drive as a template, or the dimensions shown above, mark the locations required for drilling
- Suitable cable glands to maintain the ingress protection of the drive are required. Gland holes for power and motor cables are premoulded into the drive enclosure, recommended gland sizes are shown above. Gland holes for control cables may be cut as required.

Drive Size	X Abov	e & Below	Y Either Side		
	mm	in	mm	in	
2	200	7.87	10	0.39	
3	200	7.87	10	0.39	

Note:

Typical drive heat losses are approximately 3% of operating load conditions.

Above are guidelines only and the operating ambient temperature of the drive MUST be maintained at all times.

Cable Gland Sizes						
Frame	Power Cable	Motor Cable	Control Cables			
2	M25 (PG21)	M25 (PG21)	M20 (PG13.5)			
3	M25 (PG21)	M25 (PG21)	M20 (PG13.5)			

3.8. **Gland Plate and Lock Off**

The use of a suitable gland system is required to maintain the appropriate IP / Nema rating. The gland plate has pre moulded cable entry holes for power and motor connections suitable for use with glands as shown in the following table. Where additional holes are required, these can be drilled to suitable size. Please take care when drilling to avoid leaving any particles within the product.

Cable Gland recommended Hole Sizes & types:									
	Pov	ver & Motor Cables		Control & Signal Cal	oles				
	Moulded Hole	Imperial Gland	Metric Gland	Knockout Size	Imperial Gland	Metric Gland			
	Size								
Size 1	22mm	PG13.5	M20	22mm	PG13.5	M20			
Size 2 & 3	27mm	PG21	M25	22mm	PG13.5	M20			

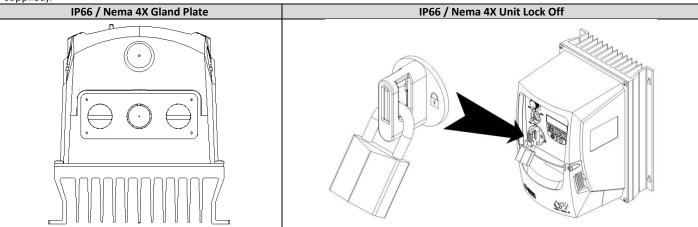

Flexible Conduit Hole Sizes:

	Drill Size	Trade Size	Metric
Size 1	28mm	¾ in	21
Size 2 & 3	35mm	1 in	27

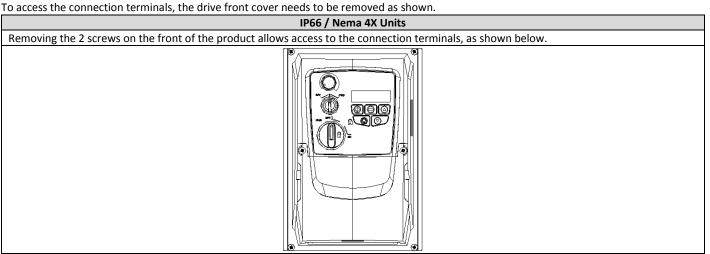

- UL rated ingress protection ("Type") is only met when cables are installed using a UL recognized bushing or fitting for a flexibleconduit system which meets the required level of protection ("Type")
- For conduit installations the conduit entry holes require standard opening to the required sizes specified per the NEC
- Not intended for rigid conduit system

Power Isolator Lock Off

On the switched models the main power isolator switch can be locked in the 'Off' position using a 20mm standard shackle padlock (not supplied).

3.9. **Removing the Terminal Cover**

3.10. **Routine Maintenance**

The drive should be included within the scheduled maintenance program so that the installation maintains a suitable operating environment, this should include:

- Ambient temperature is at or below that set out in the "Environment" section.
- Heat sink fans freely rotating and dust free.
- The Enclosure in which the drive is installed should be free from dust and condensation; furthermore ventilation fans and air filters should be checked for correct air flow.

Checks should also be made on all electrical connections, ensuring screw terminals are correctly torqued; and that power cables have no signs of heat damage.

4. Power Wiring

4.1. Grounding the Drive

This manual is intended as a guide for proper installation. Invertek Drives Ltd cannot assume responsibility for the compliance or the non-compliance to any code, national, local or otherwise, for the proper installation of this drive or associated equipment. A hazard of personal injury and/or equipment damage exists if codes are ignored during installation.

This Optidrive contains high voltage capacitors that take time to discharge after removal of the main supply. Before working on the drive, ensure isolation of the main supply from line inputs. Wait ten (10) minutes for the capacitors to discharge to safe voltage levels. Failure to observe this precaution could result in severe bodily injury or loss of life.

Only qualified electrical personnel familiar with the construction and operation of this equipment and the hazards involved should install, adjust, operate, or service this equipment. Read and understand this manual and other applicable manuals in their entirety before proceeding. Failure to observe this precaution could result in severe bodily injury or loss of life.

Grounding Guidelines

The ground terminal of each Optidrive should be individually connected DIRECTLY to the site ground bus bar (through the filter if installed). Optidrive ground connections should not loop from one drive to another, or to, or from any other equipment. Ground loop impedance must confirm to local industrial safety regulations. To meet UL regulations, UL approved ring crimp terminals should be used for all ground wiring connections.

The drive Safety Ground must be connected to system ground. Ground impedance must conform to the requirements of national and local industrial safety regulations and/or electrical codes. The integrity of all ground connections should be checked periodically. Protective Earth Conductor

The Cross sectional area of the PE Conductor must be at least equal to that of the incoming supply conductor.

Safety Ground

This is the safety ground for the drive that is required by code. One of these points must be connected to adjacent building steel (girder, joist), a floor ground rod, or bus bar. Grounding points must comply with national and local industrial safety regulations and/or electrical codes.

Motor Ground

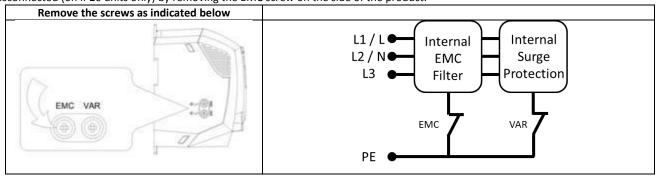

The motor ground must be connected to one of the ground terminals on the drive.

Ground Fault Monitoring

As with all inverters, a leakage current to earth can exist. The Optidrive is designed to produce the minimum possible leakage current whilst complying with worldwide standards. The level of current is affected by motor cable length and type, the effective switching frequency, the earth connections used and the type of RFI filter installed. If an ELCB (Earth Leakage Circuit Breaker) is to be used, the following conditions apply: -

- A Type B Device must be used
- The device must be suitable for protecting equipment with a DC component in the leakage current
- Individual ELCBs should be used for each Optidrive

Drives with an EMC filter have an inherently higher leakage current to Ground (Earth). For applications where tripping occurs the EMC filter can be disconnected (on IP20 units only) by removing the EMC screw on the side of the product.

The Optidrive product range has input supply voltage surge suppression components fitted to protect the drive from line voltage transients, typically originating from lightning strikes or switching of high power equipment on the same supply.

When carrying out a HiPot (Flash) test on an installation in which the drive is built, the voltage surge suppression components may cause the test to fail. To accommodate this type of system HiPot test, the voltage surge suppression components can be disconnected by removing the VAR screw. After completing the HiPot test, the screw should be replaced and the HiPot test repeated. The test should then fail, indicating that the voltage surge suppression components are once again in circuit.

Shield Termination (Cable Screen)

The safety ground terminal provides a grounding point for the motor cable shield. The motor cable shield connected to this terminal (drive end) should also be connected to the motor frame (motor end). Use a shield terminating or EMI clamp to connect the shield to the safety ground terminal.

4.2. Wiring Precautions

Connect the Optidrive according to sections 4.8.1 and 4.8.2, ensuring that motor terminal box connections are correct. There are two connections in general: Star and Delta. It is essential to ensure that the motor is connected in accordance with the voltage at which it will be operated. For more information, refer to section 4.5 Motor Terminal Box Connections.

It is recommended that the power cabling should be 4-core PVC-insulated screened cable, laid in accordance with local industrial regulations and codes of practice.

4.3. Incoming Power Connection

- For 1 phase supply, power should be connected to L1/L, L2/N.
- For 3 phase supplies, power should be connected to L1, L2, and L3. Phase sequence is not important.
- For compliance with CE and C Tick EMC requirements, a symmetrical shielded cable is recommended.
- A fixed installation is required according to IEC61800-5-1 with a suitable disconnecting device installed between the Optidrive and the AC Power Source. The disconnecting device must conform to the local safety code / regulations (e.g. within Europe, EN60204-1, Safety of machinery).
- The cables should be dimensioned according to any local codes or regulations. Guideline dimensions are given in section 9.2.
- Suitable fuses to provide wiring protection of the input power cable should be installed in the incoming supply line, according to the data in section 9.2. The fuses must comply with any local codes or regulations in place. In general, type gG (IEC 60269) or UL type T fuses are suitable; however in some cases type aR fuses may be required. The operating time of the fuses must be below 0.5 seconds.
- Where allowed by local regulations, suitably dimensioned type B MCB circuit breakers of equivalent rating may be utilised in place of fuses, providing that the clearing capacity is sufficient for the installation.
- When the power supply is removed from the drive, a minimum of 30 seconds should be allowed before re-applying the power. A
 minimum of 5 minutes should be allowed before removing the terminal covers or connection.
- The maximum permissible short circuit current at the Optidrive Power terminals as defined in IEC60439-1 is 100kA.
- An optional Input Choke is recommended to be installed in the supply line for drives where any of the following conditions occur:-
 - The incoming supply impedance is low or the fault level / short circuit current is high
 - The supply is prone to dips or brown outs
 - o An imbalance exists on the supply (3 phase drives)
 - The power supply to the drive is via a busbar and brush gear system (typically overhead Cranes).
- In all other installations, an input choke is recommended to ensure protection of the drive against power supply faults. Part numbers are shown in the table.

Supply	Frame Size	AC Input Inductor		
220 Valt	1	OPT-2-L1016-20		
230 Volt 1 Phase	2	OPT-2-L1025-20		
1 Pilase	3	N/A		
400 \/ = +	2	OPT-2-L3006-20		
400 Volt 3 Phase	2	OPT-2-L3010-20		
3 Pilase	3	OPT-2-L3036-20		

4.4. Drive and Motor Connection

- The drive inherently produces fast switching of the output voltage (PWM) to the motor compared to the mains supply, for motors which have been wound for operation with a variable speed drive then there is no preventative measures required, however if the quality of insulation is unknown then the motor manufacturer should be consulted and preventative measures may be required.
- The motor should be connected to the Optidrive U, V, and W terminals using a suitable 3 or 4 core cable. Where a 3 core cable is utilised, with the shield operating as an earth conductor, the shield must have a cross sectional area at least equal to the phase conductors when they are made from the same material. Where a 4 core cable is utilised, the earth conductor must be of at least equal cross sectional area and manufactured from the same material as the phase conductors.
- The motor earth must be connected to one of the Optidrive earth terminals.
- For compliance with the European EMC directive, a suitable screened (shielded) cable should be used. Braided or twisted type screened cable where the screen covers at least 85% of the cable surface area, designed with low impedance to HF signals are recommended as a minimum. Installation within a suitable steel or copper tube is generally also acceptable.
- The cable screen should be terminated at the motor end using an EMC type gland allowing connection to the motor body through the largest possible surface area
- Where drives are mounted in a steel control panel enclosure, the cable screen may be terminated directly to the control panel using a suitable EMC clamp or gland, as close to the drive as possible.
- For IP66 drives, connect the motor cable screen to the internal ground clamp

4.5. Motor Terminal Box Connections

Most general purpose motors are wound for operation on dual voltage supplies. This is indicated on the nameplate of the motor. This operational voltage is normally selected when installing the motor by selecting either STAR or DELTA connection. STAR always gives the higher of the two voltage ratings.

Incoming Supply Voltage	Motor Nameplate Voltages		Connection
230	230 / 400	Delta	O O O
400	400 / 690		U V W
400	230 / 400	Star	STAR A

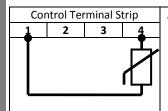

4.6. Motor Thermal overload Protection.

4.6.1. Internal Thermal Overload Protection.

The drive has an in-built motor thermal overload function; this is in the form of an "I.t-trP" trip after delivering >100% of the value set in P-08 for a sustained period of time (e.g. 150% for 60 seconds).

4.6.2. Motor Thermistor Connection

Where a motor thermistor is to be used, it should be connected as follows:-

Additional Information

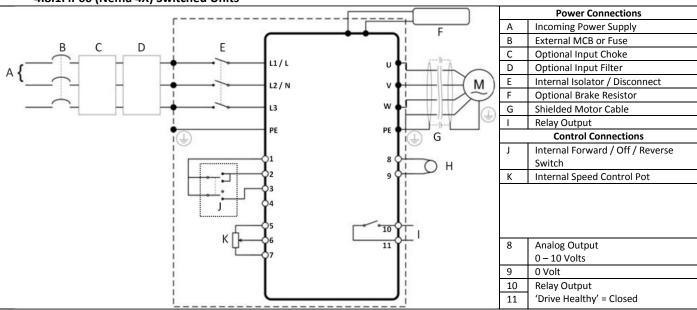

- Compatible Thermistor : PTC Type, 2.5kΩ trip level
- Use a setting of P-15 that has Input 3 function as External Trip, e.g. P-15 = 3. Refer to section 7 for further details.

4.7. **Control Terminal Wiring**

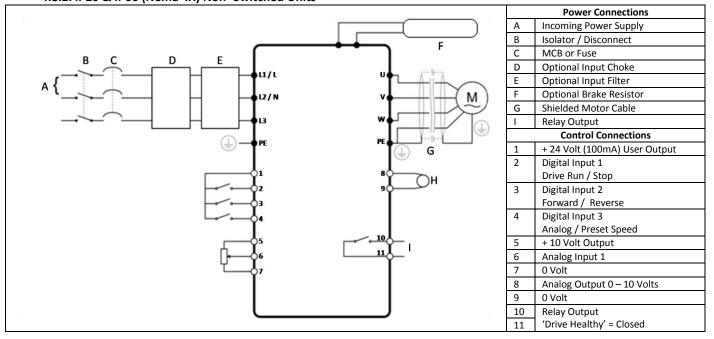

- All analog signal cables should be suitably shielded. Twisted pair cables are recommended.
- Power and Control Signal cables should be routed separately where possible, and must not be routed parallel to each other.
- Signal levels of different voltages e.g. 24 Volt DC and 110 Volt AC, should not be routed in the same cable.
- Maximum control terminal tightening torque is 0.5Nm.
- Control Cable entry conductor size: $0.05 2.5 \text{mm}^2 / 30 12 \text{ AWG}$.

4.8. **Connection Diagram**

4.8.1. IP66 (Nema 4X) Switched Units

4.8.2. IP20 & IP66 (Nema 4X) Non-Switched Units

4.9. Using the REV/0/FWD Selector Switch (Switched Version Only)

By adjusting the parameter settings the Optidrive can be configured for multiple applications and not just for Forward or Reverse. This could typically be for Hand/Off/Auto applications (also known and Local/Remote) for HVAC and pumping industries.

	Switch Position	•	Parameters to Set		Notes
	Switch Position		P-12	P-15	Notes
Run Reverse	STOP	Run Forward	0	0	Factory Default Configuration Run Forward or Reverse with speed controlled from the Local POT
STOP	STOP	Run Forward	0	5,7	Run forward with speed controlled form the local POT Run Reverse - disabled
Preset Speed 1	STOP	Run Forward	0	1	Run Forward with speed controlled from the Local POT Preset Speed 1 provides a 'Jog' Speed set in P-20
Run Reverse	STOP	Run Forward	0	6, 8	Run Forward or Reverse with speed controlled from the Local POT
Run in Auto	STOP	Run in Hand	0	4	Run in Hand – Speed controlled from the Local POT Run in Auto 0 Speed controlled using Analog input 2 e.g. from PLC with 4-20mA signal.
Run in Speed Control	STOP	Run in PI Control	5	1	In Speed Control the speed is controlled from the Local POT In PI Control, Local POT controls PI set point
Run in Preset Speed Control	STOP	Run in PI Control	5	0, 2, 4,5, 812	In Preset Speed Control, P-20 sets the Preset Speed In PI Control, POT can control the PI set point (P-44=1)
Run in Hand	STOP	Run in Auto	3	6	Hand – speed controlled from the Local POT Auto – Speed Reference from Modbus
Run in Hand	STOP	Run in Auto	3	3	Hand – Speed reference from Preset Speed 1 (P-20) Auto – Speed Reference from Modbus

To be able to adjust parameter P-15, extended menu access must be set in P-14 (default value is 101)

4.10. Control Terminal Connections

Default Connections Control Terminal		Signal	Description		
	1	+24V User Output,	+24V, 100mA.		
2		Digital Input 1	Positive logic	01/ 201/06	
	3	"Logic 1" input voltage range: 8V "Logic 0" input voltage range: 0V			
(3)	4	Digital Input 3 / Analog Input 2	Digital: 8 to 30V Analog: 0 to 10V, 0 to 20mA	or 4 to 20mA	
5	5	+10V User Output	put +10V, 10mA, 1kΩ minimum		
6	6	Analog Input 1 / Digital Input 4	Analog: 0 to 10V, 0 to 20mA Digital: 8 to 30V	or 4 to 20mA	
7	7	0V	User ground connected term	ninal 9	
(N) (8) (9) (9) (1) (1) (1) (1) (1) (1) (1) (1) (1) (1	8	Analog Output / Digital Output	Analog: 0 to 10V, Digital: 0 to 24V	20mA maximum	
10	9	0V	User ground connected term	ninal 7	
11	10	Relay Common			
	11	Relay NO Contact	Contact 250Vac, 6A / 30Vdc,	5A	

5. Operation

5.1. Managing the Keypad

The drive is configured and its operation monitored via the keypad and display.

THE GITTE	e is configured t	and its operation monitored via the keypad and display.	
\bigcirc	NAVIGATE	Used to display real-time information, to access and exit parameter edit mode and to store parameter changes	
	UP	Used to increase speed in real-time mode or to increase parameter values in parameter edit mode	
	DOWN	Used to decrease speed in real-time mode or to decrease parameter values in parameter edit mode	
	RESET / STOP	Used to reset a tripped drive. When in Keypad mode is used to Stop a running drive.	
\Diamond	START	When in keypad mode, used to Start a stopped drive or to reverse the direction of rotation if bi-directional keypad mode is enabled	

Changing Parameters

To change a parameter value press and hold the 🥯 key for >1s whilst the drive displays 5ヒロピ. The display changes to ピーロリ, indicating
parameter 01. Press and release the \bigcirc key to display the value of this parameter. Change to the required value using the \triangle and ∇ keys.
Press and release the 🔾 key once more to store the change. Press and hold the 🔾 key for >1s to return to real-time mode. The display shows
550P if the drive is stopped or the real-time information (e.g. speed) if the drive is running

Reset Factory Default Settings

To reset factory default parameters, press \triangle , ∇ and \bigcirc for >2s. The display shows P- dEF. Press the \bigcirc button to acknowledge and reset the drive.

5.2. Terminal Control

When delivered, the Optidrive is in the factory default state, meaning that it is set to operate in terminal control mode and all parameters (P-xx) have the default values as indicated in section 6 Parameters.

- 1. Connect the drive and motor according to the connection diagram shown at the beginning of this User Guide
- 2. Enter motor data from motor nameplate, P-07 = motor rated voltage, P-08 = motor rated current, P-09 = motor rated frequency.
- 3. With the potentiometer set to zero, switch on the supply to the drive. The display will show $5 \pm \rho P$.
- 4. Close the control switch, terminals 1-2. The drive is now 'enabled' and the output frequency/speed are controlled by the potentiometer. The display shows zero speed in Hz ($H = \Omega.\Omega$) with the potentiometer turned to minimum.
- 5. Turn the potentiometer to maximum. The motor will accelerate to 50Hz (the default value of P-01) under the control of the accelerating ramp time P-03. The display shows 50Hz (H = 50.0) at max speed.
- 6. To display motor current (A), briefly press the (Navigate) key.
- 7. Press again to return to speed display.
- 8. To stop the motor, either turn the potentiometer back to zero or disable the drive by opening the control switch (terminals 1-2).

If the enable/disable switch is opened the drive will decelerate to stop at which time the display will show $5 \pm \alpha P$. If the potentiometer is turned to zero with the enable/disable closed the display will show H = 0.0 (0.0Hz), if left like this for 20 seconds the drive will go into standby mode, display shows $5 \pm \alpha db H$, waiting for a speed reference signal.

5.3. Keypad Control

To allow the Optidrive to be controlled from the keypad in a forward direction only, set P-12 =1:

- 1. Connect the drive and motor according to the connection diagram shown at the beginning of this User Guide
- 2. Enable the drive by closing the switch between control terminals 1 & 2. The display will show 5 L ο P.
- 3. Press the \bigcirc key. The display shows H $\square . \square$.
- 4. Press \triangle to increase speed.
- 5. The drive will run forward, increasing speed until \triangle is released. The rate of acceleration is controlled by the setting of P-03, check this before starting.
- 6. Press ∇ to decrease speed. The drive will decrease speed until ∇ is released. The rate of deceleration is limited by the setting in P-04
- 7. Press the veckey. The drive will decelerate to rest at the rate set in P-04.
- 8. The display will finally show $5 \pm \sigma^P$ at which point the drive is disabled
- 9. To preset a target speed prior to enable, press the \bigcirc key whilst the drive is stopped. The display will show the target speed, use the $\triangle \& \nabla$ keys to adjust as required then press the \bigcirc key to return the display to $5 \pm a P$.
- 10. Pressing the \bigcirc key will start the drive accelerating to the target speed.

To allow the Optidrive to be controlled from the keypad in a forward and reverse direction, set P-12 =2:

- 11. Operation is the same as when P-12=1 for start, stop and changing speed.
- 12. Press the ♦ key. The display changes to H □.□.
- 13. Press \triangle to increase speed
- 14. The drive will run forward, increasing speed until \triangle is released. Acceleration is limited by the setting in P-03. The maximum speed is the speed set in P-01.
- 15. To reverse the direction of rotation of the motor, press the \bigcirc key again.

6. Parameters

6.1. Standard Parameters

5.1.	Standard Parameters				
Par.	Description	Minimum	Maximum	Default	Units
P-01	Maximum Frequency / Speed Limit	P-02	500.0	50.0 (60.0)	Hz / Rpm
	Maximum output frequency or motor speed limit – Hz or rpm. If P-10 >0, the v	alue entered ,	displayed is i	n Rpm	
P-02	Minimum Frequency / Speed Limit	0.0	P-01	0.0	Hz / Rpm
	Minimum speed limit – Hz or rpm. If P-10 >0, the value entered / displayed is i	n Rpm			
P-03	Acceleration Ramp Time	0.00	600.0	5.0	S
	Acceleration ramp time from 0.0 to base frequency (P-09) in seconds.				
P-04	Deceleration Ramp Time	0.00	600.0	5.0	S
İ	Deceleration ramp time from base frequency (P-09) to standstill in seconds. W	hen set to 0.0	0, the value of	P-24 is used.	
P-05	Stopping Mode	0	2	0	-
İ	0 : Ramp To Stop . When the enable signal is removed, the drive will ramp to s	top, with the r	ate controlled	by P-04. If the	mains
	supply is lost, the drive will try to continue running by reducing the speed of the				
	1 : Coast to Stop. When the enable signal is removed, or if the mains supply is	lost, the moto	or will coast (fr	eewheel) to st	ор
	2: Ramp To Stop. When the enable signal is removed, the drive will ramp to s	top, with the r	ate controlled	by P-04. If the	mains
	supply is lost the drive will ramp to stop using the P-24 decel ramp with dynan	nic brake conti	rol.		
P-06	Energy Optimiser	0	1	0	-
	0 : Disabled				
	1: Enabled. When enabled, the Energy Optimiser attempts to reduce the over	all energy con	sumed by the	drive and mot	or when
	operating at constant speeds and light loads. The output voltage applied to the	e motor is red	uced. The Ene	rgy Optimiser i	s intended
	for applications where the drive may operate for some periods of time with co	nstant speed	and light moto	or load, whethe	er constant
	or variable torque.				
P-07	Motor Rated Voltage	0	250 / 500	230 / 400	V
	This parameter should be set to the rated (nameplate) voltage of the motor (V	olts)			
P-08	Motor Rated Current	Drive	Rating Deper	ndent	Α
	This parameter should be set to the rated (nameplate) current of the motor

Par.	Description	Minimum	Maximum	Default	Units					
P-44	PI Reference (Setpoint) Source Select	0	1	0	1					
	Selects the source for the PID Reference / Setpoint									
<u> </u>	0 : Digital Preset Setpoint. P-45 is used									
	1 : Analog Input 1 Setpoint									
P-45 P-46	PI Digital Setpoint	0.0	100.0	0.0	%					
	When P-44 = 0, this parameter sets the preset digital reference (setpoint) used									
P-46	PI Feedback Source Select	0	2	0	-					
	0 : Analog Input 2 (Terminal 4)									
	1: Analog Input 1 (Terminal 6)									
	2 : Motor Current									
	3 : DC Bus Voltage Scaled 0 – 1000 Volts = 0 – 100%									
	4: Analog 1 – Analog 2. The value of Analog Input 2 is subtracted from Analog 1 to give a differential signal. The value is limited to 0.									
D 47	5: Largest (Analog 1, Analog 2). The largest of the two analog input values is a	1		NI/A	110.10					
P-47	Analog Input 2 Signal Format	N/A	N/A	N/A	U0-10					
	U D- ID = 0 to 10 Volt Signal									
		A 0-20 = 0 to 20mA Signal								
	E 4-20 = 4 to 20mA Signal, the Optidrive will trip and show the fault code 4-	_		elow 3mA						
	r 4-20 = 4 to 20mA Signal, the Optidrive will ramp to stop if the signal level falls below 3mA									
	E 20-4 = 20 to 4mA Signal, the Optidrive will trip and show the fault code 4-20F if the signal level falls below 3mA									
	r 20-4 = 20 to 4mA Signal, the Optidrive will ramp to stop if the signal level falls below 3mA									
P-48	Standby Mode Timer	0.0	250.0	0.0	S					
	When standby mode is enabled, the drive will enter standby mode following a period of operating at minimum speed (P-02) for the									
	time set in P-48. When in Standby Mode, the drive display shows 5Lndby , and the output to the motor is disabled.									
	Standby mode can be disabled by setting P-48 = 0.0									
P-49	PI Control Wake Up Error Level	0.0	100.0	0.0	%					
	When the drive is operating in PI Control Mode (P-12 = 5 or 6), and Standby Mode is enabled (P-48 > 0.0), P-49 can be used to define									
	the PI Error Level (E.g. difference between the setpoint and feedback) for which			,	his allows					
	the drive to ignore small feedback errors and remain in Standby mode until the	e feedback dro	ps sufficiently	<i>'</i> .						
P-50	Thermal Overload Value Retention	0	1	0	-					
	0 : Disabled.									
	1: Enabled. All Optidrives feature electronic thermal overload protection for t			•						
	against damage. An internal overload accumulator monitors the motor output									
	exceeds the thermal limit. When P-50 is disabled, removing the power supply		and re-applyi	ng will reset th	ne value of					
	the accumulator. When P-50 is enabled, the value is retained during power off	f.								

6.3. Adjusting the Voltage / Frequency (V/f) characteristics

The V/f characteristic is defined by several parameters as follows:-

P-07: Motor Rated Voltage

P-09: Motor Rated Frequency

The voltage set in parameter P-07 is applied to the motor at the frequency set Under normal operating conditions, the voltage is linearly reduced at any point below the motor rated frequency to maintain a constant motor torque output as shown by the line 'A' on the graph.

By using parameters P-28 and P-29, the voltage to be applied at a particular frequency can be directly set by the user, thereby altering the V/F characteristic.

Reducing the voltage at a particular frequency reduces the current in the motor and hence the torque and power, hence this function can be used in fan and pump applications where a variable torque output is desired by setting the parameters as follows:-

P-28 = P-07 / 4

P-29 = P-09 / 2

This function can also be useful if motor instability is experienced at certain frequencies, if this is the case increase or decrease the voltage (P-28) at the speed of instability (P-29).

For applications requiring energy saving, typically HVAC and pumping, the energy optimiser (P-06) parameter can be enabled. This automatically reduces the applied motor voltage on light load.

4. P-00 Read Only Status Parameters

	Description	Display range	Explanation
P00-0 I	1st Analog input value	0 100%	100% = max input voltage
P00-02	2nd Analog input value	0 100%	100% = max input voltage
P00-03	Speed reference input	-P-01 P-01	Displayed in Hz if P-10 = 0, otherwise displayed in RPM
P00-04	Digital input status	Binary value	Drive digital input status
P00-05	Internal Temperature	-10 - 50°C	Displays the internal drive temperature
P00-06	DC Bus Ripple	0 – 150V	Displays the level of voltage ripple present on the DC Bus, used for phase loss and imbalance monitoring
P00-07	Applied motor voltage	0 600V AC	Value of RMS voltage applied to motor
P00-08	DC bus voltage	0 1000V dc	Internal DC bus voltage
P00-09	Internal Heatsink temperature	-20 100 °C	Temperature of heatsink in [°] C
P00- 10	Hours run meter	0 to 99 999 hours	Not affected by resetting factory default parameters
P00- 11	Run time since last trip (1)	0 to 99 999 hours	Run-time clock stopped by drive disable (or trip), reset on next enable only if a trip occurred. Reset also on next enable after a drive power down.
P00- 12	Run time since last trip (2)	0 to 99 999 hours	Run-time clock stopped by drive disable (or trip), reset on next enable only if a trip occurred (under-volts not considered a trip) – not reset by power down / power up cycling unless a trip occurred prior to power down
P00- 13	Run time since last disable	0 to 99 999 hours	Run-time clock stopped on drive disable, value reset on next enable
P00- 14	Drive Effective Switching Frequency	4 to 32 kHz	Actual drive effective output switching frequency. This value maybe lower than the selected frequency in P-17 if the drive is too hot. The drive will automatically reduce the switching frequency to prevent an over temperature trip and maintain operation.
P00- 15	DC bus voltage log	0 1000V	8 most recent values prior to trip, updated every 250ms
P00- 16	Thermistor temperature log	-20 120 °C	8 most recent values prior to trip, updated every 500ms
רו -009	Motor current	0 to 2x rated current	8 most recent values prior to trip, updated every 250ms
P00- 18	Software ID, IO & motor ctrl	e.g. "1.00", "47AE"	Version number and checksum. "1" on LH side indicates I/O processor, "2" indicates motor control
P00- 19	Drive serial number	000000 999999 00-000 99-999	Unique drive serial number e.g. 540102 / 32 / 005
P00-20	Drive identifier	Drive rating	Drive rating, drive type e.g. 0.37, 1 230,3P-out

Parameter group zero access and navigation

When P-14 = P-37, all P-00 parameters are visible. Default value is 101.

When the user scrolls to P-00, pressing will display "POO-XX", where XX represents the secondary number within P-00. (i.e. 1 to 20). The
User can then scroll to the required P-00 parameter.
Pressing once more will then display the value of that particular group zero parameter.

For those parameters which have multiple values (e.g. software ID), pressing the \triangle and ∇ keys will display the different values within that parameter.

Pressing \bigcirc returns to the next level up. If \bigcirc is then pressed again (without pressing \triangle or ∇), the display changes to the next level up (main parameter level, i.e. P-00).

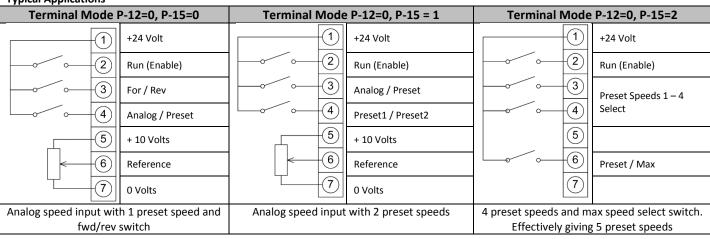

If \triangle or ∇ is pressed whilst on the lower level (e.g. P00-05) to change the P-00 index, pressing <NAVIGATE> quickly displays that parameter value.

Typical Applications

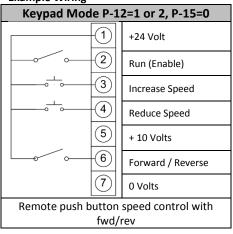

7.2. Keypad Mode (P-12 = 1 or 2)

	keypau Mode (F-12 – 1 of 2)								
P-15	Digital input 1 (T2)	Digital input 2 (T3)	Digital input 3 (T4)	Analog input (T6)	Comments				
0, 5,	Open: Stop (disable)	Closed : remote UP push-	Closed : remote DOWN	Open : Forward					
812	Closed: Run (enable)	button	push-button	+24V : Reverse					
1	Open: Stop (disable) Closed: Run (enable)	No effect	No effect	No effect	Speed reference = PI Controller Output				
2	Open: Stop (disable) Closed: Run (enable)	Closed : remote UP push- button	Closed : remote DOWN push-button	Open: Keypad speed ref +24V: Preset speed 1					
3 ¹⁾	Open: Stop (disable) Closed: Run (enable)	Closed : remote UP push- button	External trip input : Open: Trip, Closed: Run	Closed : remote DOWN push-button	Connect external motor thermistor PTC type or similar to digital input 3				
4	Open: Stop (disable) Closed: Run (enable)	Closed : remote UP push- button	Open: Keypad speed ref Closed: Analog input 1	Analog input 1					
6 ¹⁾	Open: Stop (disable) Closed: Run (enable)	Open : Forward run Closed : Reverse run	External trip input : Open: Trip, Closed: Run	Open : Keypad speed ref +24V : Preset speed 1	Connect external motor thermistor PTC type or similar to digital input 3				
7	Open: Forward Stop Closed: Forward Run	Open: Reverse Stop Closed: Reverse Run	External trip input : Open: Trip, Closed: Run	Open : Keypad speed ref +24V : Preset speed 1	Closing digital inputs 1 and 2 together carries out a fast stop (P-24)				

Example Wiring

NOTE

By default if the enable signal is present the drive will not Enable until the START button is pressed. To automatically enable the drive when the enable signal is present set P-31 = 2 or 3. This then disables the use of the START & STOP buttons

7.3. Modbus Control Mode (P-12 = 3 or 4)

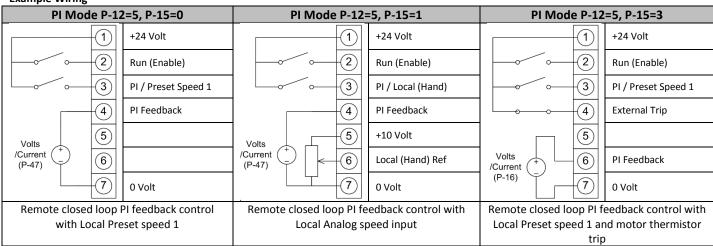

P-15	Digital input 1 (T2)	Digital input 2 (T3)	Digital input 3 (T4)	Analog input (T6)	Comments
0, 2, 45, 812	Open: Stop (disable) Closed: Run (enable)	No effect	No effect	No effect	Run and stop commands given via the RS485 link and Digital input 1 must be closed for the drive to run.
1	Open: Stop (disable) Closed: Run (enable)	No effect	No effect	No effect	Speed reference = PI Controller Output
3 ¹⁾	Open: Stop (disable) Closed: Run (enable)	Open : Master speed ref Closed : Preset speed 1	External trip input : Open: Trip, Closed: Run	No effect	Connect external motor thermistor PTC type or similar to digital input 3
6 ¹⁾	Open: Stop (disable) Closed: Run (enable)	Open : Master speed ref Closed : Analog input	External trip input : Open: Trip, Closed: Run	Analog input reference	Master Speed Ref - start and stop controlled via RS485.
7 1)	Open: Stop (disable) Closed: Run (enable)	Open : Master speed ref Closed : keypad speed ref	External trip input : Open: Trip, Closed: Run	No effect	Keypad Speed Ref - drive auto runs if digital input 1 closed, depending on P-31 setting

For further information on the MODBUS RTU Register Map information and communication setup; please contact your Invertek Drives Sales Partner.

7.4. User PI Control Mode (P-12 = 5 or 6)

P-15	Digital input 1 (T2)	Digital input 2 (T3)	Digital input 3 (T4)	Analog input (T6)	Comments
0, 2, 912	Open: Stop (disable) Closed: Run (enable)	Open : PI control Closed : Preset speed 1	PI feedback analog input	Analog input 1	Analog Input 1 can provide an adjustable PI setpoint, by setting P-44 = 1
1	Open: Stop (disable) Closed: Run (enable)	Open : PI control Closed : Analog input 1	PI feedback analog input	Analog input 1	Analog Input 1 can provide an adjustable PI setpoint, by setting P-44 = 1
3, 7 ¹⁾	Open: Stop (disable) Closed: Run (enable)	Open : PI control Closed : Preset speed 1	External trip input : Open: Trip, Closed: Run	PI feedback analog input	Connect external motor thermistor PTC type or similar to digital input 3
4	Normally Open (NO) Momentary close to run	Normally Closed (NC) Momentary open to stop	PI Feedback Analog Input	Analog Input 1	Normally Open (NO) Momentary close to run
5	Normally Open (NO) Momentary close to run	Normally Closed (NC) Momentary open to stop	Open: PI Control Closed: Preset Speed 1	PI Feedback Analog Input	Normally Open (NO) Momentary close to run
6	Normally Open (NO) Momentary close to run	Normally Closed (NC) Momentary open to stop	Open: External Trip Closed: Run	PI Feedback Analog Input	Normally Open (NO) Momentary close to run
8	Open: Stop (disable) Closed: Run (enable)	Open : Forward run Closed : Reverse run	PI feedback analog input	Analog input 1	Analog Input 1 can provide an adjustable PI setpoint, by setting P-44 = 1

Example Wiring

NOTE

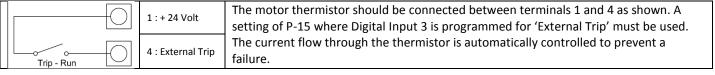

By default the PI reference is set for a digital reference level set in P-45.

When using an Analog reference set P-44 = 1 (analog) and connect reference signal to analog input 1 (T6).

The default settings for proportional gain (P-41), integral gain (P-42) and feedback mode (P-43) are suitable for most HVAC and pumping applications.

The analog reference used for PI controller can also be used as the local speed reference when P15=1.

7.5. Motor Thermistor Connection

8. Modbus RTU Communications

8.1. Introduction

The Optidrive E2 can be connected to a Modbus RTU network via the RJ45 connector on the front of the drive.

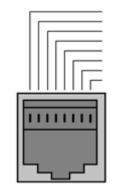

8.2. Modbus RTU Specification

Protocol	Modbus RTU		
Error check CRC			
Baud rate	9600bps, 19200bps, 38400bps, 57600bps, 115200bps (default)		
Data format	1 start bit, 8 data bits, 1 stop bits, no parity.		
Physical signal	RS 485 (2-wire)		
User interface	RJ45		

8.3. RJ45 Connector Configuration

For full MODBUS RTU register map information please refer to your Invertek Drives Sales Partner.

When using MODBUS control the Analog and Digital Inputs can be configured as shown in section 7.3

- No Connection
- No Connection
- 0 Volts -RS485 (PC)
- +RS485 (PC)
- +24 Volt
- 7 -RS485 (Modbus RTU)
 - +RS485 (Modbus RTU)

Warning:

This is not an Ethernet connection. Do not connect directly to an Ethernet port.

8.4. Modbus Telegram Structure

The Optidrive ODE-2 supports Master / Slave Modbus RTU communications, using the 03 Read Holding Registers and 06 Write Single Holding Register commands. Many Master devices treat the first Register address as Register 0, therefore it may be necessary to convert the Register Numbers detail in section 8.5 by subtracting 1 to obtain the correct Register address. The telegram structure is as follows:-

Command 03 – Read Holding Registers								
Master Telegram	Lei	Length		Slave Response	Le	ngth		
Slave Address	1	Byte		Slave Address	1	Byte		
Function Code (03)	1	1 Byte		Starting Address	1	Byte		
1 st Register Address	2	Bytes		1 st Register Value	2	Bytes		
No. Of Registers	2	Bytes		2 nd Register Value	2	Bytes		
CRC Checksum	2	2 Bytes		Etc				
				CRC Checksum	2	Bytes		

Command 06 – Write Single Holding Register									
Master Telegram	Lei	Length		Slave Response	Le	ngth			
Slave Address	1	1 Byte		Slave Address	1	Byte			
Function Code (06)	1	1 Byte		Function Code (06)	1	Byte			
Register Address	2	Bytes		Register Address	2	Bytes			
Value	2	Bytes		Register Value	2	Bytes			
CRC Checksum	2	Bytes		CRC Checksum	2	Bytes			

8.5. Modbus Register Map

Register	Par.	Tuno	Supported	F	unction	Pango	Explanation
Number		Туре	Commands	Low Byte	High Byte	Range	Explanation
1	-	R/W	03,06	Drive Control Command		03	16 Bit Word.
							Bit 0 : Low = Stop, High = Run Enable
							Bit 1 : Low = Decel Ramp 1 (P-04), High = Decel
							Ramp 2 (P-24)
							Bit 2 : Low = No Function, High = Fault Reset
							Bit 3 : Low – No Function, High = Coast Stop
							Request
2	-	R/W	03,06	Modbus Speed r	reference setpoint	05000	Setpoint frequency x10, e.g. 100 = 10.0Hz
4	-	R/W	03,06	Acceleration and	d Deceleration Time	060000	Ramp time in seconds x 100, e.g. 250 = 2.5 seconds
6	-	R	03	Error code	Drive status		Low Byte = Drive Error Code, see section 10.1
							High Byte = Drive Status as follows :-
							0 : Drive Stopped
							1: Drive Running
							2: Drive Tripped
7		R	03	Output Motor Fi	requency	020000	Output frequency in Hz x10, e.g. 100 = 10.0Hz
8		R	03	Output Motor C	urrent	0480	Output Motor Current in Amps x10, e.g. 10 = 1.0 Amps
11	-	R	03	Digital input stat	tus	015	Indicates the status of the 4 digital inputs
					5 p		Lowest Bit = 1 Input 1
20	P00-01	R	03	Analog Input 1 v	Analog Input 1 value		Analog input % of full scale x10, e.g. 1000 = 100%
21	P00-02	R	03	Analog Input 2 value		01000	Analog input % of full scale x10, e.g. 1000 = 100%
22	P00-03	R	03	Speed Reference Value		01000	Displays the setpoint frequency x10, e.g. 100 = 10.0Hz
23	P00-08	R	03	DC bus voltage		01000	DC Bus Voltage in Volts
24	P00-09	R	03	Drive temperatu	ire	0100	Drive heatsink temperature in °C

All user configurable parameters are accessible as Holding Registers, and can be Read from or Written to using the appropriate Modbus command. The Register number for each parameter P-04 to P-047 is defined as 128 + Parameter number, e.g. for parameter P-15, the register number is 128 + 15 = 143. Internal scaling is used on some parameters, for further details, please contact your Invertek Drives Sales Partner.

9. Technical Data

9.1. Environmental

Storage ambient temperature range : -40 ... 60°C

Maximum altitude : 2000m. Derate above 1000m : 1% / 100m

Maximum humidity : 95%, non-condensing

NOTE For UL compliance: the average ambient temperature over a 24 hour period for 200-240V, 2.2kW and 3HP, IP20 drives is 45°C.

9.2. Rating Tables

110 - 11	110 - 115 Volt (+ / - 10%) 1 Phase Input, 3 Phase 230V Output

3	11	15	28.0	32	35	10	8	24	4	10	100	50

Note: For UL compliance, Motor Cable to be 75°C Copper, fuse current ratings in brackets (), UL Class T must be used.

9.3. Additional Information for UL Compliance

Optidrive E2 is designed to meet the UL requirements. In order to ensure full compliance, the following must be fully observed.

- For an up to date list of UL compliant products, please refer to UL listing NMMS.E226333
- The drive can be operated within an ambient temperature range as stated in section 9.1
- For IP20 units, installation is required in a pollution degree 1 environment
- For IP66 (Nema 4X) units, installation in a pollution degree 2 environment is permissible
- UL Listed ring terminals / lugs must be used for all bus bar and grounding connections

Input Power Supply Re	Input Power Supply Requirements									
Supply Voltage	200 – 240 RMS Volts for 2	30 Volt rated units, +	/- 10% variation allowed	ed. 240 Volt RMS Maximum						
	380 – 480 Volts for 400 Vo	380 – 480 Volts for 400 Volt rated units, + / - 10% variation allowed, Maximum 500 Volts RMS								
Imbalance	Maximum 3% voltage vari	Maximum 3% voltage variation between phase – phase voltages allowed								
	All Optidrive E2 units have	phase imbalance mo	onitoring. A phase imba	lance of > 3% will result in the drive tripping.						
	For input supplies which h Pacific including China) Inv			cally the Indian sub- continent & parts of Asia finput line reactors.						
Frequency	50 – 60Hz + / - 5% Variation	n								
Short Circuit Capacity	Voltage Rating	Min kW (HP)	Max kW (HP)	Maximum supply short-circuit current						
	115V	0.37 (0.5)	1.1 (1.5)	5kA rms (AC)						
	230V	0.37 (0.5)	4 (5)	5kA rms (AC)						
	400 / 460V	0.75 (1)	11 (15)	5kA rms (AC)						
	All the drives in the above table are suitable for use on a circuit capable of delivering not more than the above specified maximum short-circuit Amperes symmetrical with the specified maximum supply voltage.									
Motor Cable	75°C Copper must be used									
Fusing	UL Class T Fuses must be used									
Incoming natural strank	connection must be accord	ling to soction 12		•						

Incoming power supply connection must be according to section 4.3

All Optidrive E2 units are intended for indoor installation within controlled environments which meet the condition limits shown in section a 1

Branch circuit protection must be installed according to the relevant national codes. Fuse ratings and types are shown in section 9.2

Suitable Power and motor cables should be selected according to the data shown in section 9.2

Power cable connections and tightening torques are shown in section 3.1

Optidrive E2 provides motor overload protection in accordance with the National Electrical Code (US).

- Where a motor thermistor is not fitted, or not utilised, Thermal Overload Memory Retention must be enabled by setting P-50 = 1
- Where a motor thermistor is fitted and connected to the drive, connection must be carried out according to the information shown in section 7.5

10. **Trouble Shooting**

	Code Mess Fault		Corrective Action
Display Fault Code	Number	Description	Corrective Action
StoP	0x00	Drive is healthy and in a stopp	led condition. The motor is not energised. No enable signal is present to start the drive
		Factory Default parameters	Press the STOP key, drive is ready to configure for particular application
P-dEF	0X0A	have been loaded	
0-1	0x03	Instantaneous Over current on the drive output. Excess load or shock load on the motor.	Fault occurs immediately on drive enable or run command Check the output wiring connections to the motor and the motor for short circuits phase to phase and phase to earth. Fault occurs during motor starting Check the motor is free to rotate and there are no mechanical blockages. If the motor has a brake fitted, check the brake is releasing correctly. Check for the correct star-delta motor wiring. Ensure the motor nameplate current is correctly entered in P-08. Increase the acceleration time in P-03. Reduce the motor boost voltage setting in P-11 Fault occurs when motor operating at constant speed Investigate overload or malfunction. Fault occurs during motor acceleration or deceleration
		Motor thermal overload	The Accel/Decel times are too short requiring too much power. If P-03 or P-04 cannot be increased, a bigger drive may be required Ensure the correct motor nameplate current value is entered in P-08. Check for correct
I.E-ErP	0x04	protection trip. The drive has tripped after delivering >100% of value in P-08 for a period of time to prevent damage to the motor.	Star or Delta wiring configuration. Check to see when the decimal points are flashing (which indicates the output current > P-08 value) and either increase acceleration ramp (P-03) or decrease motor load. Check the total motor cable length is within the drive specification. Check the load mechanically to ensure it is free, and that no jams, blockages or other mechanical faults exist
OI - 6	0x01	Brake channel over current (excessive current in the brake resistor)	Check the cabling to the brake resistor and the brake resistor for short circuits or damage. Ensure the resistance of the brake resistor is equal to or greater than the minimum value for the relevant drive shown in the table in section 9.2
OL-br	0x02	Brake resistor thermal overload. The drive has tripped to prevent damage to the brake resistor	Only occurs if P-34 = 1. The internal software protection for the brake resistor has activated to prevent damage to the brake resistor. If an Invertek standard braking resistor is being used, P-34 MUST be 1 Increase the deceleration time (P-04) or 2 nd deceleration time (P-24). Reduce the load inertia For Other Brake Resistors Ensure the resistance of the brake resistor is equal to or greater than the minimum value for the relevant drive shown in the table in section 9.2. Use an external thermal protection device for the brake resistor. In this case, P-34 may be set to 2
P5-E-P	0x05	Hardware Over Current	Check the wiring to motor and the motor for phase to phase and phase to earth short circuits. Disconnect the motor and motor cable and retest. If the drive trips with no motor connected, it must be replaced and the system fully checked and retested before a replacement unit is installed.
O.Uo IE	0x06	Over voltage on DC bus	Check the supply voltage is within the allowed tolerance for the drive. If the fault occurs on deceleration or stopping, increase the deceleration time in P-04 or install a suitable brake resistor and activate the dynamic braking function with P-34
U.Uo IE	0x07	Under voltage on DC bus	The incoming supply voltage is too low. This trip occurs routinely when power is removed from the drive. If it occurs during running, check the incoming power supply voltage and all components in the power feed line to the drive.
0-E	0x08	Heatsink over temperature	The drive is too hot. Check the ambient temperature around the drive is within the drive specification. Ensure sufficient cooling air is free to circulate around the drive. Increase the panel ventilation if required. Ensure sufficient cooling air can enter the drive, and that the bottom entry and top exit vents are not blocked or obstructed.
U-E	0x09	Under temperature	Trip occurs when ambient temperature is less than -10°C. Temperature must be raised over -10°C in order to start the drive.
th-FLt	0x10	Faulty thermistor on heatsink.	Refer to your IDL Authorised Distributor.
E-tr iP	0x0B	(on digital Input 3)	E-trip requested on digital input 3. Normally closed contact has opened for some reason. If motor thermistor is connected check if the motor is too hot.
5C-trP	0x0C	Comms loss trip	Check communication link between drive and external devices. Make sure each drive in the network has its unique address.
P-L055	0x0E	Input phase loss trip	Drive intended for use with a 3 phase supply has lost one input phase.
5PI n-F dALA-F	0x0F 0x11	Spin start failed Internal memory fault.	Spin start function failed to detect the motor speed. Parameters not saved, defaults reloaded.
4-20 F	0x11	Analog input current out of	Try again. If problem recurs, refer to your IDL Authorised Distributor. Check input current in range defined by P-16.
		range	Defeate your IDL Authorized Distributes
5C-FLE	-	Internal drive Fault	Refer to your IDL Authorised Distributor.
FAULLY	-	Internal drive Fault	Refer to your IDL Authorised Distributor.
